

Sisemed is with the environment

Integral Support Services to Electromedicine SL (Sisemed), periodically identifies and evaluates its environmental aspects, both in normal and abnormal operating conditions and in potential emergency situations, identifying those likely to have a significant impact on the environment.

Significant environmental aspects are controlled and managed in order to reduce their potential environmental impact, for which SISEMED is accredited in the ISO 14001 Environment standard.

This commitment to good environmental practices can be seen in our reduction of pollution from our staff's vehicle fleet, considerably reducing our emissions by having a fleet with more hybrid vehicles and, in the very near future, electric ones. With our carbon footprint control we reduce pollution, it is one of our environmental aspects that we consider significant.

Our staff is aware of the reduction of waste and its recycling, that's why we have different recycling points in our offices, and of course, in the workplaces where Sisemed collaborates, following the standards set by our customers.

Sisemed expects from all its collaborators, customers, suppliers and all the parties that make up our environment, their help in caring for our planet and guidelines for environmental behavior with a view to maintaining a sustainable future.
